

Handout 6: quantification I

Obligatory reading: Kearns (2011), pp. 96-103, on QM+
Optional reading: Kearns (2011), pp. 118-121, also on QM+

1 Quantifiers as relations between sets (from Introduction to Semantics; only atomic individuals!)

- (1) *Every* vampire yawns
- (2) *Most* vampires yawn
- (3) *No* vampire yawns
- (4) *Some* vampires yawn
- (5) *Three* vampires yawn

Quantifiers: *every, most, some, no...etc.*

Quantifier phrases: *every vampire, most vampires, no vampires, etc.*

Both VPs and common nouns denote sets of individuals:

(7) $\llbracket \text{vampire}(s) \rrbracket^s = \{x: x \text{ is a vampire in } s\}$

(8) $\llbracket \text{yawn}(s) \rrbracket^s = \{x: x \text{ yawns in } s\}$

If a, b and c are the vampires of s, and b, c and d the yawning individuals:

(9) $\llbracket \text{vampire}(s) \rrbracket^s = \{a, b, c\}$

(10) $\llbracket \text{yawn}(s) \rrbracket^s = \{b, c, d\}$

Quantified NPs denote sets of sets of individuals:

- (11) a. $\llbracket \text{every vampire} \rrbracket^s = \{Q : \llbracket \text{vampire} \rrbracket^s \subseteq Q\}$
- b. $\llbracket \text{most vampires} \rrbracket^s = \{Q : |\llbracket \text{vampires} \rrbracket^s \cap Q| > |\llbracket \text{vampires} \rrbracket^s - Q|\}$
- c. $\llbracket \text{no vampire} \rrbracket^s = \{Q : \llbracket \text{vampire} \rrbracket^s \cap Q = \emptyset\}$
- d. $\llbracket \text{some vampires} \rrbracket^s = \{Q : \llbracket \text{vampires} \rrbracket^s \cap Q \neq \emptyset\}$
- e. $\llbracket \text{three vampires} \rrbracket^s = \{Q : |\llbracket \text{vampires} \rrbracket^s \cap Q| = 3\}$

We need to use the second part of the subject-predicate rule to compute the meaning of the whole sentence:

Subject-predicate rule: If S has NP as its subject and VP as its predicate, $\llbracket S \rrbracket^s = 1$ in s if $\llbracket \text{NP} \rrbracket^s \in \llbracket \text{VP} \rrbracket^s$ or $\llbracket \text{VP} \rrbracket^s \in \llbracket \text{NP} \rrbracket^s$

2 Taking grammatical number into account

(12) Every vampire yawns

$$\begin{aligned} \llbracket \text{every vampire yawns} \rrbracket^s = 1 \text{ iff} \\ \llbracket \text{yawns} \rrbracket^s \in \llbracket \text{every vampire} \rrbracket^s \\ = \llbracket \text{yawns} \rrbracket^s \in \{Q : \llbracket \text{vampire} \rrbracket^s \subseteq Q\} \\ = \llbracket \text{vampire} \rrbracket^s \subseteq \llbracket \text{yawns} \rrbracket^s \end{aligned}$$

Intuitively, if a, b and c are the vampires in s, and b, c and d the yawners in s, the sentence is false:

$$\begin{aligned} \llbracket \text{vampire} \rrbracket^s &= \{a, b, c\} \\ \llbracket \text{yawns} \rrbracket^s &= \{b, c, d, bc, bd, cd, bcd\}, \\ \text{and } \{a, b, c\} &\not\subseteq \{b, c, d, bc, bd, cd, bcd\} \quad \checkmark \end{aligned}$$

Intuitively, if a, b and c are the vampires in s, and a, b, c and d the yawners in s, the sentence is true:

$$\begin{aligned} \llbracket \text{vampire} \rrbracket^s &= \{a, b, c\} \\ \llbracket \text{yawns} \rrbracket^s &= \{a, b, c, d, ab, ac, bc, bd, cd, \dots, abc, \dots, abcd\}, \\ \text{and } \{a, b, c\} &\subseteq \{a, b, c, d, ab, ac, bc, bd, cd, \dots, abc, \dots, abcd\} \quad \checkmark \end{aligned}$$

(13) Some vampires yawn

$$\begin{aligned} \llbracket \text{some vampires yawn} \rrbracket^s = 1 \text{ iff} \\ \llbracket \text{yawn} \rrbracket^s \in \llbracket \text{some vampires} \rrbracket^s \\ = \llbracket \text{yawn} \rrbracket^s \in \{Q : \llbracket \text{vampires} \rrbracket^s \cap Q \neq \emptyset\} \\ = \llbracket \text{vampires} \rrbracket^s \cap \llbracket \text{yawn} \rrbracket^s \neq \emptyset \end{aligned}$$

Intuitively, if a, b and c are the vampires in s, and d, e and f the yawners in s, the sentence is false:

$$\begin{aligned} \llbracket \text{vampires} \rrbracket^s &= \{ab, bc, ac, abc\} \\ \llbracket \text{yawns} \rrbracket^s &= \{d, e, f, de, df, ef, def\}, \\ \text{and } \{ab, bc, ac, abc\} \cap \{d, e, f, de, df, ef, def\} &= \emptyset \quad \checkmark \end{aligned}$$

Intuitively, if a, b and c are the vampires in s, and a, b, d and e the yawners in s, the sentence is true:

$$\begin{aligned} \llbracket \text{vampires} \rrbracket^s &= \{ab, bc, ac, abc\} \\ \llbracket \text{yawns} \rrbracket^s &= \{a, b, d, e, ab, ad, bd, de, \dots, abd, \dots, abde\}, \\ \text{and } \{ab, bc, ac, abc\} \cap \{a, b, d, e, ab, ad, bd, de, \dots, abd, \dots, abde\} &= \{ab\} \neq \emptyset \quad \checkmark \end{aligned}$$

What about other quantified NPs? → Puzzle 6!

3 Taking collective VPs into account

(14) Some vampires met in the hallway

$$\begin{aligned} \llbracket \text{some vampires met in the hallway} \rrbracket^s = 1 & \text{ iff} \\ \llbracket \text{met in the hallway} \rrbracket^s & \in \llbracket \text{some vampires} \rrbracket^s \\ & = \llbracket \text{met in the hallway} \rrbracket^s \in \{Q : \llbracket \text{vampires} \rrbracket^s \cap Q \neq \emptyset\} \\ & = \llbracket \text{vampires} \rrbracket^s \cap \llbracket \text{met in the hallway} \rrbracket^s \neq \emptyset \end{aligned}$$

Intuitively, if a, b and c are the vampires in s, and a, d and e met in the hallway in s, the sentence is false:

$$\begin{aligned} \llbracket \text{vampires} \rrbracket^s & = \{ab, bc, ac, abc\} \\ \llbracket \text{met in the hallway} \rrbracket^s & = \{ad, ae, de, ade\}, \\ \text{and } \{ab, bc, ac, abc\} \cap \{ad, ae, de, ade\} & = \emptyset \quad \checkmark \end{aligned}$$

Intuitively, if a, b, c, d and e are the vampires in s, and a, b, c met in the hallway in s, the sentence is true:

$$\begin{aligned} \llbracket \text{vampires} \rrbracket^s & = \{ab, bc, ac, ad, bd, cd, ae, \dots, abc, \dots, abce, \dots abcde\} \quad \checkmark \\ \llbracket \text{met in the hallway} \rrbracket^s & = \{ab, bc, ac, abc\}, \\ \text{and } \{ab, bc, ac, ad, bd, cd, abc, \dots, abcd\} \cap \{ab, bc, ac, abc\} & = \{ab, bc, ac, abc\} \neq \emptyset \end{aligned}$$

(15) *Every vampire met in the hallway

$$\begin{aligned} \llbracket \text{every vampire met in the hallway} \rrbracket^s = 1 & \text{ iff} \\ \llbracket \text{met in the hallway} \rrbracket^s & \in \llbracket \text{every vampire} \rrbracket^s \\ & = \llbracket \text{met in the hallway} \rrbracket^s \in \{Q : \llbracket \text{vampire} \rrbracket^s \subseteq Q\} \\ & = \llbracket \text{vampire} \rrbracket^s \subseteq \llbracket \text{met in the hallway} \rrbracket^s \end{aligned}$$

Suppose that a, b and c are the vampires in s, and a, b and c met in the hallway in s:

$$\begin{aligned} \llbracket \text{vampire} \rrbracket^s & = \{a, b, c\} \\ \llbracket \text{met in the hallway} \rrbracket^s & = \{ab, bc, ac, abc\}, \\ \text{and } \{a, b, c\} & \not\subseteq \{ab, bc, ac, abc\} \end{aligned}$$

The sentence can never be true, as that last statement can never be satisfied, no matter what the facts are → the sentence is odd \checkmark
