Lung cancer

Dr Heather Lewis
Honorary Clinical Lecturer
Newham University Hospital
Aims and objectives

- To understand the epidemiology of lung cancer
- To appreciate the patient experience of lung cancer
- To revise the pathogenesis and classification of lung cancer
- To recognise the clinical signs associated with lung cancer and its sequelae
- To describe the treatment of lung cancer
Why learn about lung cancer?

- 180,000 people per year die of lung cancer in the US
- Commonest cancer in the UK
- Cause of 13% of cancer cases and 18% of cancer deaths worldwide
- 35,000 new cases a year
- 21% 1 year survival
- 5-6% 5 year survival
Richard Doll - Epidemiologist
“The risk of developing the disease increases in proportion to the amount smoked. It may be 50 times as great in those who smoke 25 or more cigarettes a day as among non-smokers”

Conclusion of article in BMJ in 1950
Lead author - Richard Doll (who stopped smoking because of his findings!)
Warnings introduced on cigarette packets in 2003
Patient experience - 1

Please click on the link which takes you to the “healthtalkonline” website where you can view videos of patients describing their experience of being diagnosed with lung cancer

http://www.healthtalkonline.org/Cancer/Lung_Cancer/Topic/1300/
Risk factors

• **Smoking:**
  • 90% of all lung cancers are caused by smoking
  • 40 pack yr history = 20x risk of developing lung cancer of non-smoker
• Radiation therapy
• Environmental toxins:
  • Second hand smoke, asbestos, radon, arsenic
• Pulmonary fibrosis
• HIV
• Genetic factors
Case study 1

• 64 year old woman, presents to GP with a 6 week history of a cough

• She also complains of tiredness, weight gain and weakness general aches and pains

• What do you want to know?
Examination

**General inspection:**
Observations stable

**Respiratory system:**
Bronchial breathing RLZ
Decreased percussion note RLZ

**Cardiovascular system:**
Normal heart sounds
Apex non displaced

**Gastrointestinal system:**
Soft, non tender
4 cm uneven hepatomegaly
Laboratory results

FBC:
- Hb – 10.3
- Platelets - 74
- WCC – 1.3

U&E’s
- Na – 136
- K – 4.5
- Urea – 4
- Creat - 90

LFT’s:
- Alb – 28
- ALT – 48
- AST – 56
- Alk phos – 167
- Bilirubin – 74

Bone profile:
- Corrected calcium – 2.9
- Phosphate – 1.4

24 hour urinary cortisol - high
Investigations
Investigations
What is the unifying diagnosis?

a) Atypical pneumonia
b) Large Cell carcinoma of the lung
c) Small cell carcinoma of the lung
d) Squamous cell carcinoma of the lung
e) Tuberculosis
What is the unifying diagnosis?

c) Small cell carcinoma of the lung

The combination of a lung mass, irregular hard hepatomegaly and clinical signs and investigations consistent with paraneoplastic syndromes and bone marrow suppression make small cell lung cancer the most likely diagnosis.
What is the cause of the other symptoms?

a) Cushings syndrome
b) Lambert Eaton syndrome
c) Polymyositis
What is the cause of the other symptoms?

a) Cushings syndrome

The patient has a cushingoid appearance with a round face, centripetal obesity and hirsuitism.
The raised 24 hour urinary cortisol confirms the diagnosis of Cushings syndrome.
What is the cause of the hypercalcaemia?

a) PTHrP
b) Bony metastases
c) Hyperparathyroidism
What is the cause of the hypercalcaemia?

b) Bony metastases

A raised calcium, with a normal phosphate and raised alkaline phosphatase is the classic serological finding in bony metastases. The bone scan shows areas of high pick up consistent with bony metastases.
Small Cell Lung Cancer:

- Rapidly dividing tumour
- 70% have metastases on presentation
  - Bone, liver, adrenals, brain, bone marrow
- Highly responsive to radio- and chemotherapy
- Most patients relapse
- Usually arise in central airways
- Commonly associated with paraneoplastic syndromes
- Almost always associated with smoking
Paraneoplastic syndromes

• Cushings Syndrome
  – Ectopic ACTH production
  – Classical symptoms and signs
    • Tiredness, weight gain, striae, easy bruising, dowagers hump, centripetal obesity

• Diagnosis:
  – Measure urinary cortisol and ACTH levels
    • 24 hr urinary cortisol high
    • High plasma ACTH
Paraneoplastic syndromes

• Dermatomyositis and polymyositis
  – Inflammatory myopathies
  – Gottrons sign, heliotrope rash
  – Interstitial lung disease, inflammatory arthritis
  – Characterised by muscle weakness
Gottrons Papules

Heliotrope rash

Authors: Elizabeth M. Dugan, Adam M. Huber, Frederick W. Miller, Lisa G. Rider

http://dermatology.cdlib.org/1502/reviews/photoessay/17.jpg
Paraneoplastic syndromes

• Lambert-Eaton myasthenic syndrome:
  – Disorder of neuromuscular junction transmission
  – Antibodies to voltage gated calcium channel ions
  – Occurs in 3% of SCLC
  – Neurological symptoms precede diagnosis in 80% of cases
  – Slowly progressive proximal muscle weakness
  – Autonomic involvement
  – Rarely cranial nerve involvement (cf myasthenia gravis)

• Cerebellar degenerative syndromes (Anti-Hu, anti-YO, anti-CRMP-5, anti-Pca-2, Anti-MA1)

• Cerebellar ataxia

• Limbic encephalitis (antibodies to Hu family proteins)
Hypercalcaemia in lung cancer

• Usually secondary to bony metastases
• In SCLC can be caused by tumour secretion of Parathyroid hormone related protein (PTH-rP)
• Symptoms - Anorexia, nausea, vomiting, constipation, lethargy, polyuria, polydipsia, dehydration, confusion, coma
Case study 2

- A 53 year old man
- Trumpeter in working men’s clubs
- Presents to his GP with haemoptysis and pain in his joints
Examination

General:
Swollen, plethoric face
Distended neck veins
Clubbing
Tender wrists

Respiratory:
RR = 24/min
Dull PN to left midzone
Reduced breath sounds to left midzone

CVS:
Normal

GI:
Normal
Investigations

**U&E’s:**
- Na – 125
- K – 3.6
- Urea – 7
- Creat – 94

**Midnight serum cortisol** – 4 m/dl

**Urine sodium** – 23 mEq/L

**Serum osmolality** – 240 mOsm

**FBC:**
- Normal

**Urine osmolality** – 350 mOsm

**Bone profile:**
- Corr Calcium – 2.1
- Phosphate – 0.9
X-ray hands
X-ray right femur
What is the diagnosis?

a) Atypical pneumonia
b) Large Cell carcinoma of the lung
c) Small cell carcinoma of the lung
d) Squamous cell carcinoma of the lung
e) Tuberculosis
What is the diagnosis? Answer

c) Small cell carcinoma of the lung

The combination of haemoptysis, superior vena cava obstruction and paraneoplastic signs indicates a diagnosis of SCLC
What is the cause of his joint pain?

a) Bony metastases
b) Hypertrophic pulmonary osteoarthropathy
c) Pathological fractures
d) Polymyositis
What is the cause of his joint pain?

b) Hypertrophic pulmonary osteoarthropathy

The joint pain is caused by HPOA. The x-rays show clubbing, and new periosteal bone formation on the femur both of which are hallmarks of HPOA. There are no fractures visible and the normal calcium makes bony metastases unlikely.
Hypertrophic pulmonary osteoarthropathy (HPOA)

- Presents with clubbing (which is often very marked) and joint pain
- Periosteal proliferation of tubular bones
- Diagnose with x-ray of long bones – show periosteal new bone formation
- MRI and Pet show increase uptake
HPOA – clubbing visible on X-ray
Periosteal new bone formation in HPOA
What is the cause of the hyponatraemia?

a) Addisons disease
b) Cushings syndrome
c) Hypothyroidism
d) Syndrome of inappropriate ADH secretion (SIADH)
What is the cause of the hyponatraemia?

d) Syndrome of inappropriate ADH secretion (SIADH)

The combination of hyponatraemia, low serum osmolality and high urine osmolality are classical of SIADH
Syndrome of Inappropriate ADH secretion (SIADH)

• Caused by ectopic ADH secretion

• Presentation:
  – May present with confusion and fits or other signs of hyponatremia, but is commonly asymptomatic

• Laboratory findings:
  – Hyponatremia
  – Low serum osmolality (<275mOsm/kg water)
  – High urine osmolality (> 100mOsm/kg water)
  – High urinary sodium (> 40mmol/L with normal dietary sodium intake)

• 15-40% of patients with SCLC have SIADH
Diagnosis of lung cancer - symptoms

- Haemoptysis – 25-50%
- Cough – 50-75%
- Weight Loss
- Hoarse voice
- Chest pain
- Dyspnoea
- Bronchorrhea
- Fullness in the head
- Shoulder pain
Diagnosis of lung cancer - signs

- **Systemic:**
  - Weight loss
  - Clubbing
  - Wasting of small muscles of the hand
  - Hoarse voice
  - Lymphadenopathy

- **Chest:**
  - Bronchial breathing
  - Coarse crepitations
  - Wheeze
  - Stridor
  - Pleural effusion

- **Other:**
  - Horner’s Syndrome:
    - Ptosis
    - Miosis
    - Anhydrosis
  - Superior Vena Cava Obstruction:
    - See next page
Superior Vena caval obstruction

• Symptoms:
  – Fullness in the face
  – Headache

• Signs:
  – Plethoric facies
  – Facial swelling
  – Dilated veins of the upper chest wall and face

• Caused by obstruction of the superior vena cava by external compression or thrombosis which results in increased venous pressure, interstitial oedema and retrograde collateral flow

• Most common cause is bronchial carcinoma
Classification of lung cancer

- Small Cell Lung Cancer – 13%
- Non-Small Cell Lung Cancer – 82%
  - Adenocarcinoma – 38%
  - Squamous cell carcinoma – 20%
  - Large Cell Carcinoma – 5%
  - Unclassified – 18%
- Other – 5%
Adenocarcinoma

- Peripheral
- 35-40% lung cancers
- Less commonly associated with smoking
- Bronchoalveolar carcinoma:
  - Manifests from type 2 pneumocytes along alveolar septa
  - Can manifest as solitary peripheral nodule, multifocal disease or rapidly progressive pneumonic form
  - Large amounts of watery sputum
Squamous cell carcinoma

- Usually originates near to a central bronchus
- Necrotic cavity
- 20% lung cancers
- Histologically – keratin pearls
- Can be detected on cytology as it exfoliates
Large Cell Carcinoma

• 5% of lung cancers
• Large peripheral mass
• Highly atypical cells with no evidence of keratinisation
Further investigations

• To stage cancer and distinguish SCLC from NSCLC
• Bloods:
  – FBC, U&E’s, LFT’s, Calcium,
• Staging CT chest/ abdomen/ pelvis
• +/- CT head
• Bronchoscopy
• Percutaneous transthoracic needle biopsy
• FPG-PET scan
Patient perspective

http://www.healthtalkonline.org/Cancer/Lung_Cancer/Topic/1298/

Click on the link above to go to the “healthtalkonline” website where you can view patients with lung cancer talking about their experiences with the medical profession.
Treatment of SCLC

• Limited stage:
  – Platinum based chemotherapy
  – Thoracic irradiation

• Extensive stage:
  – Platinum based chemotherapy

• Prophylactic cranial irradiation

• Palliative care
Treatment of NSCLC

• Surgical resection:
  – Stage I/ II NSCLC
  – Adequate lung function and no medical contraindications
  – Lobectomy

• Radical Radiotherapy:
  – Stage I/ II/ III NSCLC
  – Good performance status
  – Need pulmonary function tests prior to this
  – CHART regime

• Chemotherapy:
  – Stage III/ IV disease with good performance status
Prognosis

• SCLC:
  – Limited disease – 15-20 months median survival
  – Extensive disease – 8-13 months median survival

• NSCLC:
  – If resectable (stage 1) - 25-73% 5 year survival
  – Stage 2 – 25-46% 5 year survival
  – Stage 3 – 7-24% 5 year survival
  – Stage 4 – 2-13% 5 year survival
Patient perspective

Click on the link above to go to the “healthtalkonline” website to view patients with lung cancer talking about their thoughts on recurrence, death and dying.
Palliative care

- Palliative radiotherapy for relief of symptoms
- Opioids to reduce cough
- Debulking bronchoscopic procedures for relief of large airway obstruction or bleeding
- SVCO:
  - Chemotherapy/ radiotherapy dependant on stage of disease
- Cerebral metastases:
  - Steroids/ radiotherapy
- Pleural effusion drainage/ aspiration
Summary

• Lung cancer is common
• It has a poor prognosis
• Differentiation between small cell and non-small cell is important for prognosis and treatment
• Palliative care is important, as most patients will require it
