

Last time:

We defined Image and Kernel of a homomorphism of rings.

We showed that both Image and Kernel are subrings.

In fact,  $\text{Kernel}(f)$  is an ideal.

- $I$  is an ideal if it is a subring satisfying  
(I2) If  $a \in I$  and  $b \in R \Rightarrow a \cdot b \in I$ .

- 
- Example: Every ring  $R$  has two "trivial" ideals.

$$I = \{0\} \text{ and } I = R$$

- 
- Proposition: If  $R$  is a ring and  $I, J$  are ideals of  $R$  then  $I \cap J$  is an ideal of  $R$

- 
- Ex.  $R = \mathbb{Z}$ . Take  $I = 4\mathbb{Z}$ .  $J = 18\mathbb{Z}$ .  
We must have  $I \cap J$  is an ideal of  $\mathbb{Z}$ .

$$I \cap J = 36\mathbb{Z}$$

---

$$\text{In fact } m\mathbb{Z} \cap n\mathbb{Z} = \text{lcm}(m, n) \cdot \mathbb{Z}$$

---

Proof of proposition.

### Proof of proposition.

We want to show that  $I \cap J$  is an ideal.

Let's use the ideal test:

(I0)  $I \cap J \neq \emptyset$  because  $0 \in I \cap J$ .

(I1) Suppose  $a, b \in I \cap J$ . This means  $a, b \in I$  and  $a, b \in J$ . Then  $a - b \in I$  and  $a - b \in J$ , so  $a - b \in I \cap J$ .

(I2) Suppose  $a \in I \cap J$  and  $b \in R$ . This means  $a \in I$  and  $a \in J$ . Then  $a \cdot b \in I$

(because  $I$  is an ideal) and also  $a \cdot b \in J$  (because  $J$  is an ideal), so  $a \cdot b \in I \cap J$ .  $\blacksquare$

### Factor rings (or quotient rings)

Let  $R$  be a ring, and  $I$  an ideal of  $R$ .

We will construct the factor ring  $R/I$  (or quotient ring):

- The elements of  $R/I$  are the cosets of  $I$  in  $R$ .

- The operations of  $R/I$  are:

$$[a]_I + [b]_I = [a+b]_I$$

↗ definition

$[a]_I$        $[b]_I$        $[a+b]_I$   
 ↓                  ↓                  ↓  
 + in  $R/I$       + in  $R$

$$\begin{array}{c}
 \begin{array}{ccc}
 \leftarrow & \rightarrow I & \downarrow \\
 & + \text{ in } R/I &
 \end{array}
 \quad
 \begin{array}{ccc}
 \leftarrow & \rightarrow I & \downarrow \\
 & + \text{ in } R &
 \end{array}
 \end{array}$$

$$[a]_I \cdot [b]_I = [a \cdot b]_I \quad \stackrel{\text{def}}{=} \quad
 \begin{array}{c}
 \downarrow \\
 \cdot \text{ in } R/I
 \end{array} \quad
 \begin{array}{c}
 \downarrow \\
 \cdot \text{ in } R
 \end{array}$$

---

Ex:  $R = \mathbb{Z}$  and  $I = 4\mathbb{Z}$

Cosets:

$\mathbb{Z}$				
:-4	:-3	:-2	:-1	:
0	1	2	3	:
4	5	6	7	:
8	9	10	11	:
:	:	:	:	:

A
B
C
D

In the factor ring:

$$R/I = \{ A, B, C, D \}$$

+	A	B	C	D
A	A	B	C	D
B	B	C	D	A
C	C	D	A	B
D	D	A	B	C

•	A	B	C	D
A	A	A	A	A
B	A	B	C	D
C	A	C	A	C
D	A	D	C	B

Ex:  $\begin{matrix} A \\ -B \end{matrix} = \begin{matrix} 0 \\ D \end{matrix}$        $B = 1$

In fact  $\mathbb{Z}/4\mathbb{Z} \cong \mathbb{Z}_4$

---

Thm: The set  $R/\mathbb{I}$  with that addition and that multiplication is indeed a ring.

- Why are the operations of  $R/\mathbb{I}$  well-defined?  
(why do they not depend on the choice of representatives).

Suppose you want to compute

$$[a]_{\mathbb{I}} + [b]_{\mathbb{I}} = [a+b]_{\mathbb{I}}$$

$$\quad \quad \quad [a']_{\mathbb{I}} + [b']_{\mathbb{I}} = [a'+b']_{\mathbb{I}} \quad \text{why equal?}$$

This means

$$a - a' \in \mathbb{I} \quad \text{and} \quad b - b' \in \mathbb{I}$$

$$\text{so } a - a' + b - b' \in \mathbb{I}$$

$$(a+b) - (a'+b') \in \mathbb{I}$$

$$\Rightarrow [a+b]_{\mathbb{I}} = [a'+b']_{\mathbb{I}}$$

For multiplication:

$$\text{Suppose } [a]_{\mathbb{I}} = [a']_{\mathbb{I}}, \quad [b]_{\mathbb{I}} = [b']_{\mathbb{I}}$$

This means that  $a - a' \in \mathbb{I}$  and  $b - b' \in \mathbb{I}$

We want to show that

$$[a \cdot b]_{\mathbb{I}} = [a' \cdot b']_{\mathbb{I}},$$

$$[a \cdot b]_I = [a' \cdot b']_I ,$$

that is,  $a \cdot b - a' \cdot b' \in I$ .

To do this, note that  $a - a' \in I$

$$\text{so } (a - a')b \in I, \text{ and } b - b' \in I$$

$$\text{so } a'(b - b') \in I. \quad (\text{we are using that } I \text{ is an ideal, not only a subring}).$$

Adding these, we get an element of  $I$ :

$$(a - a')b + a'(b - b') = ab - \cancel{a'b} + \cancel{a'b} - a'b' \\ = ab - a'b' \in I. \quad \blacksquare$$

CW1.

(66) We want to show

$$\mathcal{C} \cong \left\{ \begin{pmatrix} a & b \\ -b & a \end{pmatrix} \mid a, b \in \mathbb{R} \right\}$$

We need to define a bijection

$$f: \mathcal{C} \longrightarrow \left\{ \begin{pmatrix} a & b \\ -b & a \end{pmatrix} \mid a, b \in \mathbb{R} \right\}$$

$$3+4i \longmapsto \begin{pmatrix} 3 & 4 \\ -4 & 3 \end{pmatrix}$$

Diagram illustrating the multiplication of complex numbers as matrix multiplication:

The diagram shows three complex numbers and their corresponding 2x2 matrices:

- $-2 + i \rightarrow \begin{pmatrix} -2 & 1 \\ -1 & -2 \end{pmatrix}$
- $1 + 5i \rightarrow \begin{pmatrix} 1 & 5 \\ -5 & 1 \end{pmatrix}$
- $-10 - 5i \rightarrow \begin{pmatrix} -10 & -5 \\ 5 & -10 \end{pmatrix}$

The first two complex numbers are grouped by a bracket labeled "sum", and the third one is grouped by a bracket labeled "product".

## Exercise:

Take  $R = 3\mathbb{Z}$  and  $I = 12\mathbb{Z}$ .

- ① Write down the partition of  $R$  into cosets of  $I$
  - ② Explain why  $I$  is a ideal of  $R$
  - ③ Write down addition and multiplication tables for  $R/I$ .
  - ④ Is  $R/I$  isomorphic to a ring we have discussed before?

$$R = 32 \text{ k} \quad I = 12 \text{ A}$$

11

<span style="border: 1px solid red; border-radius: 50%; padding: 2px;">A</span>	$\begin{array}{ccc} 12 & 24 & 15 \\ 0 & & 3 \\ -12 & & -9 \end{array}$	<span style="border: 1px solid red; border-radius: 50%; padding: 2px;">D</span>
<span style="border: 1px solid red; border-radius: 50%; padding: 2px;">B</span>	$\begin{array}{ccc} 18 & 6 & 21 \\ -6 & & 9 \\ -6 & & -3 \end{array}$	<span style="border: 1px solid red; border-radius: 50%; padding: 2px;">C</span>

Write down the tables.

Find the identity.

Isoomorphic to either  $\mathbb{Z}_4$  or  $P(\{a, b\})$ .  
Which one?
